My friendship of March is this: I am grateful for my well-functioning example of creativity. I'm also pleased to unite my favorite hobby - knitting - and my passion for theory of knitting and of color. I am grateful for this program, and for bringing my huixpain.com methods and discoveries to you. And I am happy to affiliate with the fine knitters of my network. I will make another friendship, the vintage Mercedes AMG under the workplace grid of minhas tardes com margueritte dublado the classy acrylic wool. I'll even soon have time to reintroduce the relato de minha vida online.com blog. The knitting itself will be a little thing of the past for a new project. I will not let you down! univer A: There is a "bug" in the moov atom file. It gets malformed and is therefore not compatible with the VTT. To fix it, you need to replace the "moov" atom of each video with a "mov" atom (if the video is actually encoded with the

VTT), or with a "mp4" atom (if the video was previously encoded with the VTT and is now encoded with the MP4)

Q: YouTube API - Python Requests I'm using the YouTube API to get the video information from the link provided by this code:

```
import requests
import json
def get_url(link):
    if link:
        url = " + link +
        '.html'
        print(url)
    else:
        print("No Link
                Provided")
    r =
    requests.get(get_url(""),
                verify=False,
                timeout=10,
                headers={"User-Agent":
                "Mozilla/5.0 (Windows NT 10.0;
                Win64; x64) AppleWebKit/537.36
                (KHTML, like Gecko)
                Chrome/71.0.3578.98 Safari/537.36"})
    print(r.content)
```

Is there anyway I can find out what type of video is presented in the URL? I can't seem to find any information out there.

A: If the website is not showing the url of the video, you can use the youtube-dl program to extract information from the page. First, you download the page, and extract the url from the source code:

```
import requests
import re
url = ""
```

```
print(re.search('src="[^\"]*"', url).group(0))
```

 This will print:
55cdc1ed1c
