| **TIP** --- | --- While Photoshop has numerous industry-standard features, it has a few more specialized features that create artificial lighting effects. These are some of the features that are commonly used for creating "soft boxes" or soft lighting. Figure 16-1 shows examples of these features in action. **Figure 16-1** Examples of Photoshop's lighting features This chapter takes an in-depth look at Photoshop's various lighting features. You will learn how to use these features to create realistic light effects and to create pleasing artistic effects. This chapter does not cover Photoshop's imaging capabilities; if that is your area of interest, check out Book I Chapter 6, "Creating and Manipulating Digital Images." Also, for a comprehensive collection of Photoshop tutorials, check out [www.DigitalPhotographySchool.com](http://www.DigitalPhotographySchool.com). | **TIP** --- | --- If you would like to create realistic lighting effects, you may find that these features are not the right choice for you. Many of the tutorials in this book are not written with these lighting features in mind. # **Creating a Simple Light Source** Creating lighting effects with Photoshop requires understanding the lighting theory used to create the effect. Photoshop has three simple light sources: hard, soft, and ambient. Each light source controls how the light appears in the resulting image. For example, soft lights are more diffuse, casting softer shadows, while hard lights are used to spotlight objects with a strong direct source of light (a hard light). Figure 16-2 shows different types of lighting. **Figure 16-2** Choosing lighting types ## **Creating a Basic Light Source** In this exercise, you will make a basic light source using a selection and a group. You will also find it useful to make a duplicate group, change its name, and save it. First, choose Window→New Group from the main menu and name the group Ambient Light. This simple lighting method creates a background using a group that has some color applied. This example creates a group that has a yellowish color and a 15% opacity. Next, choose Window→New Layer→RGB from the main menu, name the new layer Light, and load an image into it. If you do not see the Red, Green, and Blue boxes of the Color Picker option when you open the Layers panel, click the small triangles at the lower right to access the

Q: Emulation/Virtualisation on Linux I would like to know if there are any good and proven emulation/virtualisation utilities that are available on Linux? A: GNU Guix is an operating system capable of running its own programs, self-hosting, such as Linux distributions like Linux Mint and Arch Linux. In order to use it, you first need to set up a GNU Guile and choose between GNU Guile and Guile Scheme. They can also be installed separately on a system and be used as system-wide, non-root installations. You may also want to set up a Linux distribution which is capable of building Guix packages, like GuixSD (which is entirely based on Guix and includes many of the same packages). Then, Guix as an installation Use Guix as a new user; install Guix and choose GUIX over the graphical installer; use the command `guix self-update`; reboot into a shell; and finally, configure your shell (I like rizon) and start programming! Guix as a software environment You can install the Guix system-wide or use the command `guix new-vm`; install and configure Guix on this virtual machine; run it as a non-root user; and use the GNU Guile interpreter and build or install Guix packages. Guix as a Linux distribution As mentioned earlier, you can install the latest stable version of Guix on Arch Linux and use it as your own GNU/Linux distribution, though you may want to also install a few other software. Thermoset polyurethane membranes are used as separators in a variety of battery electrodes. These separators are traditionally made by thermoforming a polymeric membrane. Thermoforming involves shaping a polymer sheet into a membrane via a series of steps including: (1) roller pre-heating of the polymer sheet; (2) anti-stacking orientation through the heating step; (3) stamp-press orientation with a heated stamper; and (4) stamper cooling. After orientation, the stamper is raised, and the membrane remains bonded to the stamper. The stamper/membrane assembly is removed from the stamper, cut to the desired length, and then laminated to a current collector foil. Many such techniques are known in the art. In the conventional thermoforming process
